Component spec

- describing doc
  - ↳ defines the components and its func
- what the comp is doing? question
- tools
  - ↳ UML, text, formal tools (OCL, QoS modelling)
- precise, full description
  - ↳ understand behaviour
  - ↳ using
- ~~comp s~~ sections
  - structural model — skeleton, structure — connections between comps
  - func model — functionality — methods, services
  - behavioural model — behaviour — pre and post conditions
  - + decision model, docs, quality insurance
  - → operation spec.
  - → UML state diag.
  - → UML class and obj diag.

Structural spec

- methods, attributes of components
- connections between components and its restrictions
- relation with the environment
- focuses on the sys. not the environment
- enlight decomposition possibilities
- we need to sync the changes between the two structural model

Func model (spec.)

- defines the provided services and effects of the components
- Assumes, Result
  - ↳ előfeltétel ↳ utófeltétel

Behavioural spec.

- OO paradigma
- encapsulate data a func.
- states, state transitions (UML state diag.)
- (can be stateless)
- focus on Assumes and Results from func. model
- describe a component's behavior with the states (that can be see from outside) and state transitions (that result of external events)
- a component reaction to a event is depending on the current state

---

Impl of components

- collection of docs.
  - ↳ describe the implementation methods of the comp
- everything that are required for the impl.
- focus on how to make (not coding yet)

- the defined activities will change in the future

- these are abstract details

- behavioural model
  - ~~intrelia~~
  - interaction model
    ↳ control of process from the viewpoint of the comp entity
  - describes how the comp. entities collaborate with each other

  - or sequence diagram
